

Exascale Challenges: Space, Time, Experimental Science and Self Driving Cars

Joel Saltz MD, PhD
Emory University
February 2013

Integrate Information from Sensors, Images, Cameras

- Multi-dimensional spatial-temporal datasets
 - ***Radiology and Microscopy Image Analyses***
 - ***Oil Reservoir Simulation/Carbon Sequestration/
Groundwater Pollution Remediation***
 - Biomass monitoring and disaster surveillance using multiple types of satellite imagery
 - Weather prediction using satellite and ground sensor data
 - Analysis of Results from Large Scale Simulations
 - Square Kilometer Array
 - Google Self Driving Car
- Correlative and cooperative analysis of data from multiple sensor modalities and sources
- ***Equivalent from standpoint of data access patterns – we propose a integrative sensor data mini-App***

Deep Learning from Medical Imaging

	8 hrs per day*	16 hrs per day*
Average Pathology Practice $\frac{80,000 \text{ slides/yr}}{250 \text{ days/yr}} = 320 \text{ slides/day}$	1.5 min per slide	3 min per slide
Large Pathology Practice $\frac{320,000 \text{ slides/yr}}{250 \text{ days/yr}} = 1380 \text{ slides/day}$	21 s per slide	42 s per slide

Data per slide: 500MB to 100GB
Roughly 250-500M Slides/Year in USA
Total: 0.1-10 Exabytes/year

Laser Captured Microdissection -- Spatio-temporal "omic" studies

MICHAEL A. TANGREA, NCI

NIH researchers use three different types of laser-capture microdissection (LCM) technologies to dissect tissue such as the human prostate gland shown here. From top, the traditional LCM and the more automated systems—spatially invariant vector quantization (SIVQ)–LCM and expression microdissection (xMD).

Macroscopic 3-D Tissue at Micron Resolution: OSU BISTI NBIB Center Big Data (2005)

Associate genotype with phenotype

Big science experiments on cancer, heart disease, pathogen host response

Tissue specimen -- 1 cm^3

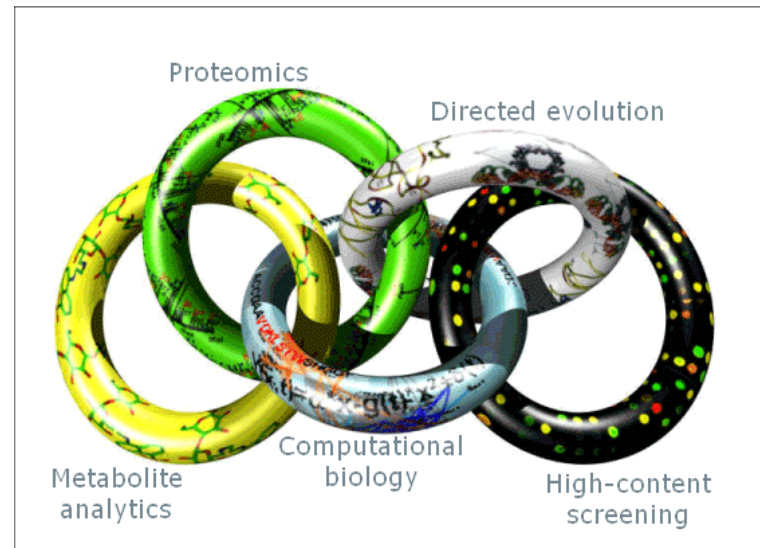

0.3μ resolution – roughly 10^{13} bytes

Molecular data (spatial location) can add additional significant factor; e.g. 10^2

Multispectral imaging, laser captured microdissection, Imaging Mass Spec, Multiplex QD

Multiple tissue specimens; another factor of 10^3

Total: 10^{18} bytes – **exabyte** per big science experiment

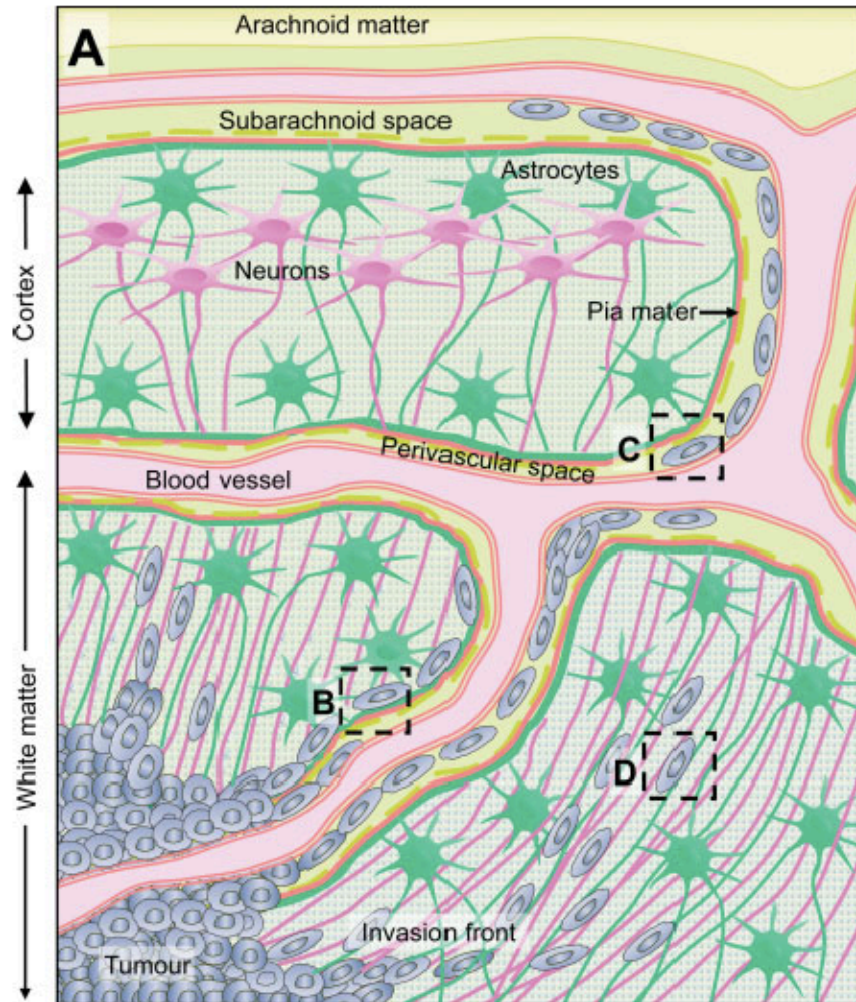

Reconstruction of Cellular Biological Structures from Optical Microscopy Data

Complex Structure/Function Interactions – Very, Very Active Materials

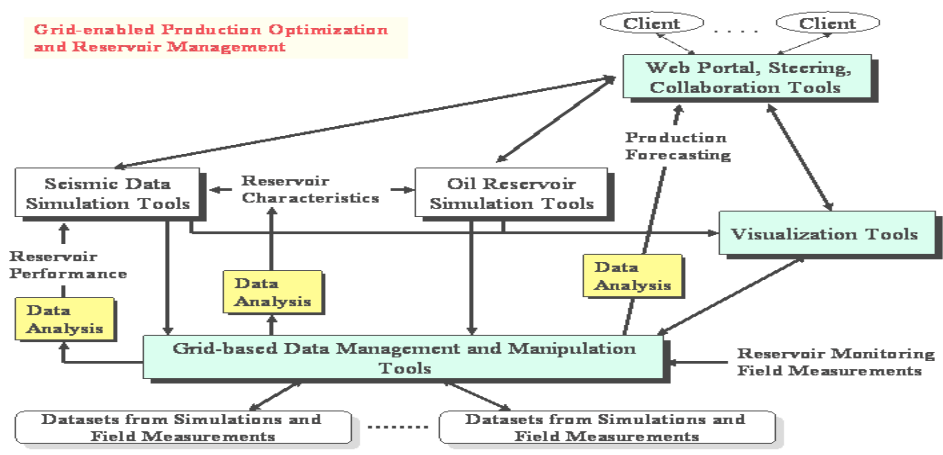

Core Transformations

- Data Cleaning and Low Level Transformations
- Data Subsetting, Filtering, Subsampling
- Spatio-temporal Mapping and Registration
- Object Segmentation
- Feature Extraction
- Object/Region/Feature Classification
- Spatio-temporal Aggregation
- Change Detection, Comparison, and Quantification

A Data Intense Challenge: The Instrumented Oil Field of the Future

ITR Proposal

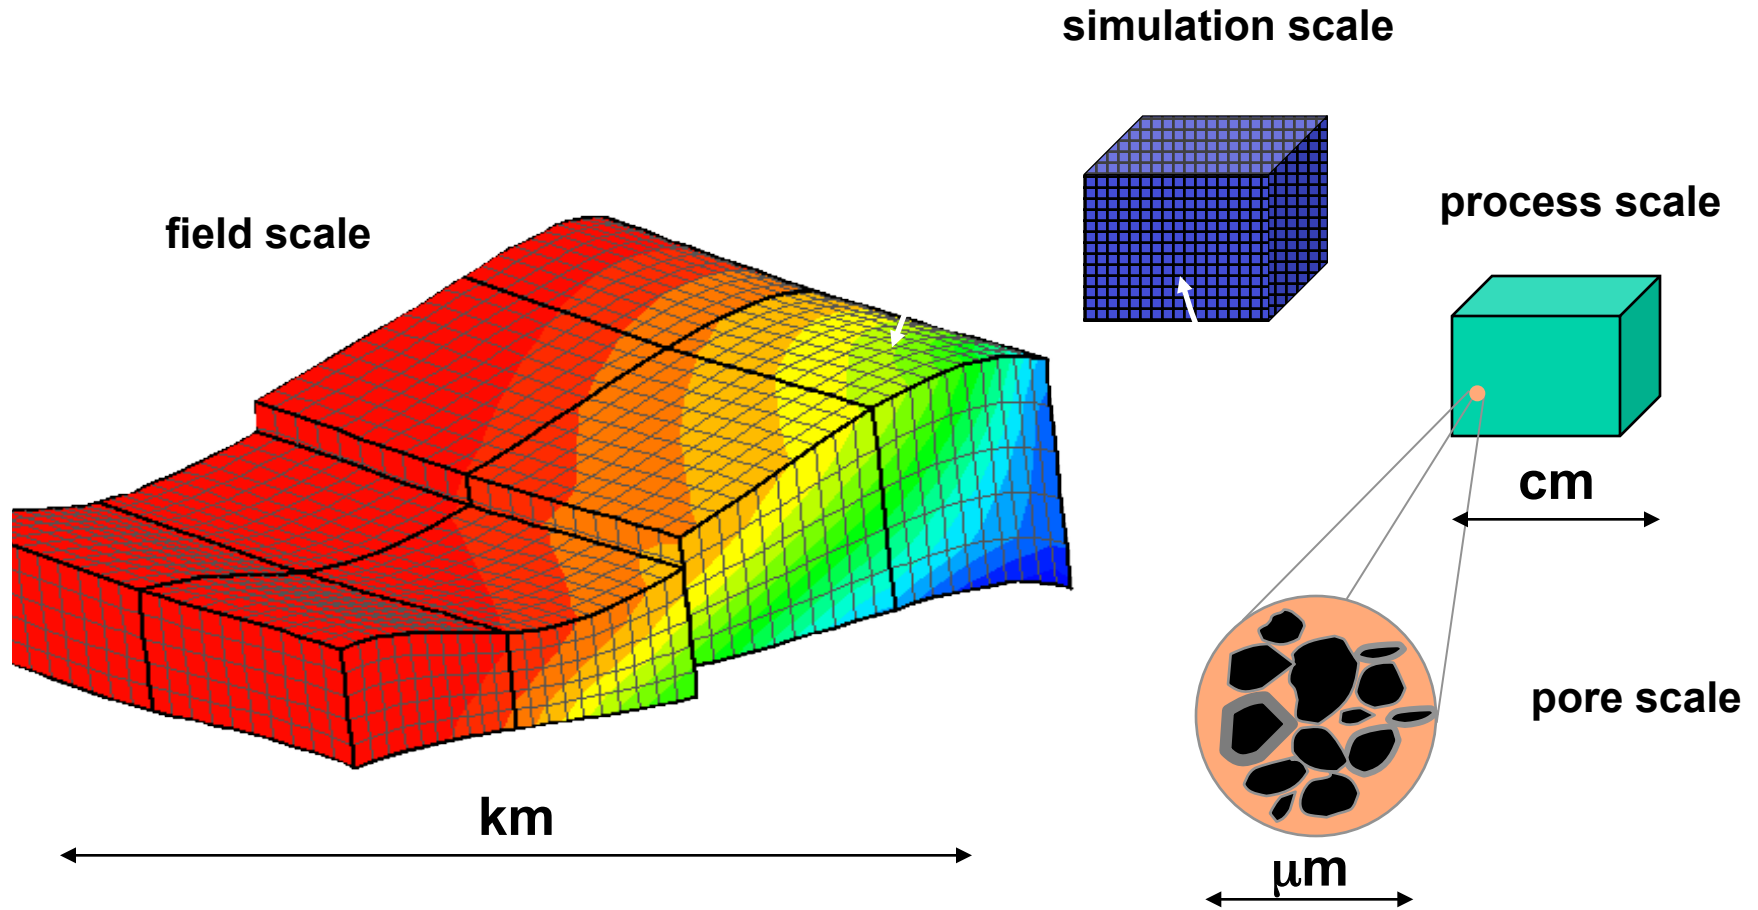

A Data Intense Challenge: The Instrumented Oilfield of the Future

Participants:

- i. University of Texas at Austin
 - CSM: Wheeler, Dawson, Peszynska
 - IG: Sen, Stoffa
 - PGE: Torres-Verdin
- ii. University of Chicago—CS: Stevens, Papka
- iii. University of Maryland—CS: Sussman
- iv. Ohio State—CS: Saltz, Kurc
- v. Rutgers—ECE: Parashar
- vi. MIT—Engineering: Haines

The Tyranny of Scale

(Tinsley Oden - U Texas)

Why Applications Get Big

- Physical world or simulation results
- Detailed description of two, three (or more) dimensional space
- High resolution in each dimension, lots of timesteps
 - e.g. oil reservoir code -- simulate 100 km by 100 km region to 1 km depth at resolution of 100 cm:
 - $10^6 * 10^6 * 10^4$ mesh points, 10^2 bytes per mesh point, 10^6 timesteps --- ***10^{24} bytes (Yottabyte) of data!!!***

Oil Field Management – Joint ITR with Mary Wheeler, Paul Stoffa

Detect and track changes in data during production
Invert data for reservoir properties
Detect and track reservoir changes

Assimilate data & reservoir properties into the evolving reservoir model

Use simulation and optimization to guide future production

Coupled Ground Water and Surface Water Simulations

Multiple codes -- e.g. fluid code, contaminant transport code

Different space and time scales

Data from a given fluid code run is used in different contaminant transport code scenarios

Bioremediation Simulation

abiotic reactions
compete with
microbes,
reduce extent of
biodegradation

Microbe colonies
(magenta)

Dissolved NAPL (blue)

Mineral oxidation
products (green)

Core Transformations (Again)

- Data Cleaning and Low Level Transformations
- Data Subsetting, Filtering, Subsampling
- Spatio-temporal Mapping and Registration
- Object Segmentation
- Feature Extraction
- Object/Region/Feature Classification
- Spatio-temporal Aggregation
- Change Detection, Comparison, and Quantification

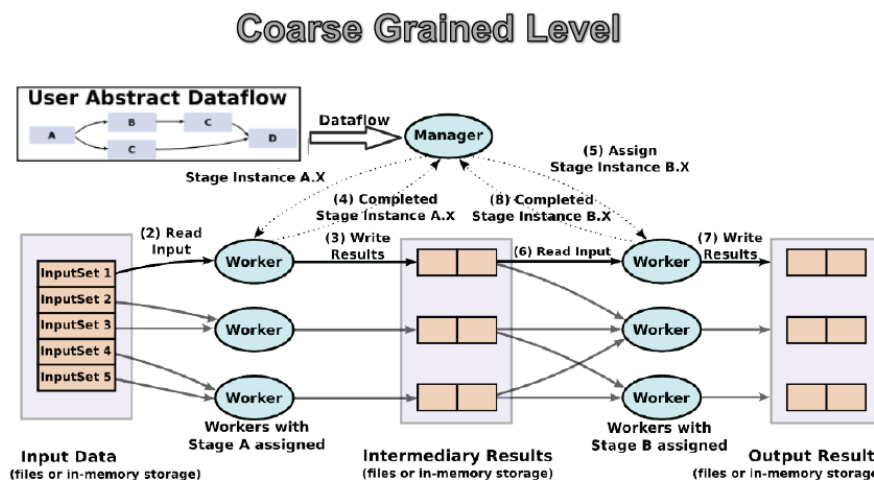

Sensor Integration and Analysis -- “Mini-app” and Co-Design Vehicle

- Tremendous commonality between applications that compose and analyze information from multiple sensors/cameras/scientific simulations
- ***Recommendation – define and publicize “abstract application class” that captures essential aspects***
- Spatio-temporal data is often accompanied by chemical species, ‘omics” or appropriate domain specific chemical information
- Computationally similar applications are currently independently developed by many research communities
- ***Biology/Medicine is not a special case!!!***
- Mini-app is quite doable and would be tremendously useful if accompanied by domain area buy-in

Runtime Support

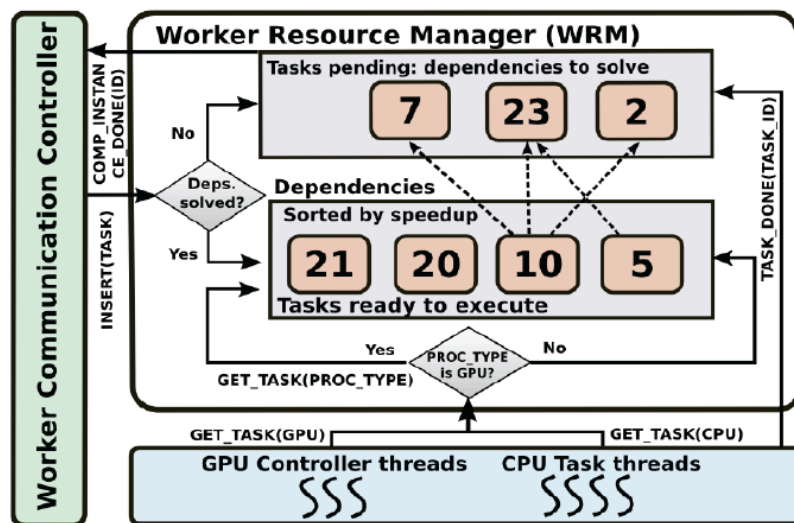

- Hierarchical dataflow/task management
- Programming model and runtime support need to work together: specify/extract tasks, dependencies
- Concurrent Collections (CnC), ParalleX Execution Model, Region Templates

Extreme DataCutter – Two Level Model

Node Level Work Scheduling

Fine Grained Level

Runtime Support Objectives

- *Coordinated* mapping of data and computation to complex memory hierarchies
- *Hierarchical* work assignment with *flexibility* capable of dealing with data dependent computational patterns, fluctuations in computational speed associated with power management, faults
- Linked to *comprehensible* programming model – model *targeted at abstract application class but not to application domain* (In the sensor, image, camera case -- Region Templates)
- Software stack including *coordinated compiler/runtime support/autotuning* frameworks

Coarse Grain Workflows: Interoperability

- Pipelines are complex and *written in multiple languages* and designed to run on *multiple environments*
- Key components needed to tackle problems may be purpose built to run on particular environments, may be *proprietary*
- Patient privacy and HIPPA issues can constrain *portions* of computations to institutional or highly secure, HIPPA certified environments
- Last mile bandwidth issues, performance/storage availability where data needs to be staged. *Large number of tactical pitfalls which erode researcher productivity*
- Data generation is cheap and often local, still expensive to move multiple TB/PB data to supercomputer centers

Exascale Hardware/Software Architecture

- *Need to stage very large datasets for relatively short periods of time* -- large aggregate bandwidth to non volatile scratch storage -- distributed flash and disk
- *Globally addressed/indexed persistent data collections* -- e.g. DataSpaces, Region Templates (GIS analogy), persistent PGAS
- *Intelligent I/O with in-transit processing*, data reduction (e.g. ADIOS)
- Visualizations need to be carried out interactively and in situ as data is produced and as computations proceed – efficient streaming data

Data Representation and Query

- Complex data models capturing multi-faceted information including markups, annotations, algorithm provenance etc.
- Much data modeling can be re-used in sensor image camera application class
- *Efficient implementations of data models*
- ADIOS, in transit processing – data, format transformations, reductions, summarizations close to data
- Key-value stores capable of supporting efficient application data access in deep, complex storage hierarchies
