

# Scikit-learn

Machine learning for the small and the many

Gaël Varoquaux

*Inria*

In this meeting, I represent low performance computing

# Scikit-learn

Machine learning for the small and the many

Gaël Varoquaux

Inria

What I do: bridging psychology to neuroscience via machine learning

on brain images

- 1 Scikit-learn
- 2 Statistical algorithms
- 3 Scaling up / scaling out?

# 1 Scikit-learn

Goals and tradeoff

**Scikit-learn's vision:** Machine learning for everyone

## Outreach

across scientific fields,  
applications, communities

**Enabling**  
foster innovation

**Scikit-learn's vision:** Machine learning for everyone

## Outreach

across scientific fields,  
applications, communities

**Enabling**  
foster innovation

**Minimal prerequisites & assumptions**

# 1 scikit-learn user base

# 1 A Python library

## Python

- High-level language, for users and developers
- General-purpose: suitable for any application
- Excellent interactive use

# 1 A Python library

## Python

- High-level language, for users and developers
- General-purpose: suitable for any application
- Excellent interactive use

Slow  $\Rightarrow$  compiled code as a backend

Python's primitive virtual machine  
makes it easy

# 1 A Python library

## Python

- High-level language, for users and developers
- General-purpose: suitable for any application
- Excellent interactive use

## Scipy

- Vibrant scientific stack
- `numpy` arrays = wrappers on C pointers
- `pandas` for columnar data
- `scikit-image` for images

# 1 A Python library

Users like Python

Google trends

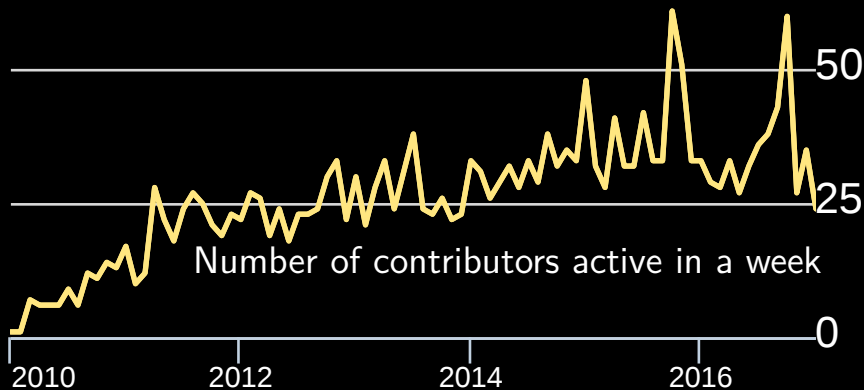

# 1 A Python library

And developers like Python

# 1 A Python library

And developers like Python

⇒ Huge set of features  
(~ 160 different statistical models)

# 1 API: simplify, but do not dumb down

## Universal estimator interface

```
from sklearn import svm
classifier = svm.SVC()
classifier.fit(X_train, Y_train)
Y_test = classifier.predict(X_test)
# or
X_red = classifier.transform(X_test)
```

# 1 API: simplify, but do not dumb down

## Universal estimator interface

```
from sklearn import svm
classifier = svm.SVC()
classifier.fit(X_train, Y_train)
Y_test = classifier.predict(X_test)
# or
X_red = classifier.transform(X_test)
```

classifier often has hyperparameters  
Finding good defaults is crucial, and hard

# 1 API: simplify, but do not dumb down

## Universal estimator interface

```
from sklearn import svm
classifier = svm.SVC()
classifier.fit(X_train, Y_train)
Y_test = classifier.predict(X_test)
# or
X_red = classifier.transform(X_test)
```

classifier often has hyperparameters  
Finding good defaults is crucial, and hard

A lot of effort on the documentation  
Example-driven development

# 1 Tradeoffs

- Algorithms and models with good failure mode
  - Avoid parameters hard to set or fragile convergence
  - Statistical computing = ill-posed & data-dependent
  
- Little or no dependencies
  - Easy build everywhere
  
- All compiled code generated from Cython
  - High-level languages give features (Spark)
  - Low-level gives speed (eg cache-friendly code)

## 2 Statistical algorithms

Fast algorithms accept statistical error

## 2 Statistical algorithms

Fast algorithms accept statistical error

**Models most used in scikit-learn:**

1. Logistic regression, SVM
2. Random forests
3. PCA
4. Kmeans
5. Naive Bayes
6. Nearest neighbor

## 2 Linear models

$$\min_{\mathbf{w}} \sum_i l(y_i, \mathbf{x}_i \mathbf{w})$$

**Many features**

Coordinate descent

Iteratively optimize *w.r.t.*  $\mathbf{w}_j$  separately

It works because:

Features are redundant

**Sparse models** can guess which  $\mathbf{w}_j$  are zero

Progress = better selection of features

## 2 Linear models

$$\min_{\mathbf{w}} \sum_i l(y_i, \mathbf{x}_i \mathbf{w})$$

**Many features**

Coordinate descent

Iteratively optimize *w.r.t.*  $\mathbf{w}_j$  separately

**Many samples**

Stochastic gradient descent

$$\min_{\mathbf{w}} \mathbb{E}[l(y, \mathbf{x} \mathbf{w})]$$

Gradient descent:

$$\mathbf{w} \leftarrow \mathbf{w} + \alpha \nabla_{\mathbf{w}} l$$

Stochastic gradient descent  $\mathbf{w} \leftarrow \mathbf{w} + \alpha \mathbb{E}[\nabla_{\mathbf{w}} l]$

Use a cheap estimate of  $\mathbb{E}[\nabla_{\mathbf{w}} l]$  (e.g. subsampling)

Progress = second order schemes

## 2 Linear models

$$\min_{\mathbf{w}} \sum_i l(y_i, \mathbf{x}_i \mathbf{w})$$

**Many features**

Coordinate descent

Iteratively optimize *w.r.t.*  $\mathbf{w}_j$  separately

**Many samples**

Stochastic gradient descent

$$\min_{\mathbf{w}} \mathbb{E}[l(y, \mathbf{x} \mathbf{w})]$$

Gradient descent:

$$\mathbf{w} \leftarrow \mathbf{w} + \alpha \nabla_{\mathbf{w}} l$$

Stochastic gradient descent  $\mathbf{w} \leftarrow \mathbf{w} + \alpha \mathbb{E}[\nabla_{\mathbf{w}} l]$

Use a cheap estimate of  $\mathbb{E}[\nabla_{\mathbf{w}} l]$  (e.g. subsampling)

**Data-access locality**

## 2 Linear models

$$\min_{\mathbf{w}} \sum_i l(y_i, \mathbf{x}_i \mathbf{w})$$

### Deep learning

Many features

- Composition of linear models
- optimized jointly (non-convex)
- with stochastic gradient descent

separately

Many samples

Stochastic gradient descent

$$\min_{\mathbf{w}} \mathbb{E}[l(y, \mathbf{x} \mathbf{w})]$$

Gradient descent:

$$\mathbf{w} \leftarrow \mathbf{w} + \alpha \nabla_{\mathbf{w}} l$$

Stochastic gradient descent  $\mathbf{w} \leftarrow \mathbf{w} + \alpha \mathbb{E}[\nabla_{\mathbf{w}} l]$

Use a cheap estimate of  $\mathbb{E}[\nabla_{\mathbf{w}} l]$  (e.g. subsampling)

**Data-access locality**

## 2 Trees & (random) forests

(on subsets of the data)

- Compute simple bi-variate statistics
- Split data accordingly

### Speed ups

- Share computing between trees or precompute
- Cache friendly access  $\Rightarrow$  optimize traversal order
- Approximate histograms / statistics

LightGBM, XGBoost

## 2 PCA: principal component analysis

Truncated SVD (singular value decomposition)

$$\mathbf{X} = \mathbf{U} \mathbf{s} \mathbf{V}^T$$

## 2 PCA: principal component analysis

Truncated SVD (singular value decomposition)

$$\mathbf{X} = \mathbf{U} \mathbf{s} \mathbf{V}^T$$

### Randomized linear algebra

→ 20x speed ups

for  $i$  in  $[1, \dots, k]$ :

$\tilde{\mathbf{X}} = \text{random\_projection}(\mathbf{X})$  # e.g. subsampling

$$\tilde{\mathbf{U}}_i, \tilde{\mathbf{s}}_i, \tilde{\mathbf{V}}_i^T = \text{SVD}(\tilde{\mathbf{X}})$$

$$\mathbf{V}_{\text{red}}, \mathbf{R} = \text{QR}([\tilde{\mathbf{V}}_1, \dots, \tilde{\mathbf{V}}_k])$$

$$\mathbf{X}_{\text{red}} = \mathbf{V}_{\text{red}}^T \mathbf{X}$$

$$\mathbf{U}' \mathbf{s}' \mathbf{V}'^T = \text{SVD}(\mathbf{X}_{\text{red}})$$

$$\mathbf{V}^T = \mathbf{V}'^T \mathbf{V}_{\text{red}}^T$$

## 2 PCA: principal component analysis

Truncated SVD (singular value decomposition)

$$\mathbf{X} = \mathbf{U} \mathbf{s} \mathbf{V}^T$$

**Randomized linear algebra**

→ 20x speed ups

for  $i$  in  $[1, \dots, k]$ :

$\tilde{\mathbf{X}} = \text{random\_projection}(\mathbf{X})$  # e.g. subsampling

$$\tilde{\mathbf{U}}_i, \tilde{\mathbf{s}}_i, \tilde{\mathbf{V}}_i^T = \text{SVD}(\tilde{\mathbf{X}})$$

$$\mathbf{V}_{\text{red}}, \mathbf{R} = \text{QR}([\tilde{\mathbf{V}}_1, \dots, \tilde{\mathbf{V}}_k])$$

$$\mathbf{X}_{\text{red}} = \mathbf{V}_{\text{red}}^T \mathbf{X}$$

$$\mathbf{U}' \mathbf{s}' \mathbf{V}'^T = \text{SVD}(\mathbf{X}_{\text{red}})$$

$$\mathbf{V}^T = \mathbf{V}'^T \mathbf{V}_{\text{red}}^T$$

$\tilde{\mathbf{X}}$  summarize well the data  
Each SVD is on local data

[Halko... 2011]

## 2 Stochastic factorization of huge matrices

Factorization of **dense** matrices  $\sim 200\,000 \times 2\,000\,000$

Data  
matrix

**X**

**U**

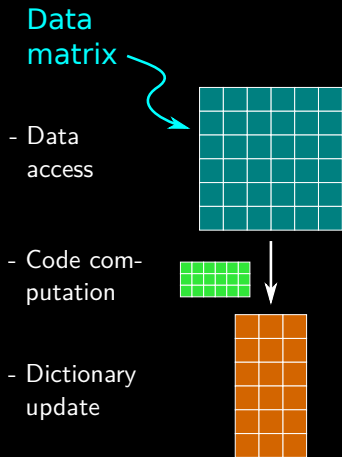

**V**

$$\min_{\mathbf{U}, \mathbf{V}} \|\mathbf{X} - \mathbf{UV}^T\|_2 + \|\mathbf{V}\|_1$$

## 2 Stochastic factorization of huge matrices

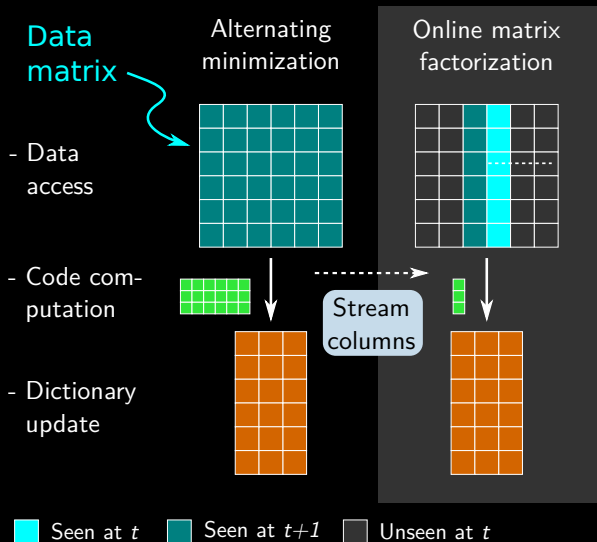

Factorization of **dense** matrices  $\sim 200\,000 \times 2\,000\,000$

$$\min_{\mathbf{U}, \mathbf{V}} \|\mathbf{X} - \mathbf{UV}^T\|_2 + \|\mathbf{V}\|_1$$

## 2 Stochastic factorization of huge matrices

Factorization of **dense** matrices  $\sim 200\,000 \times 2\,000\,000$

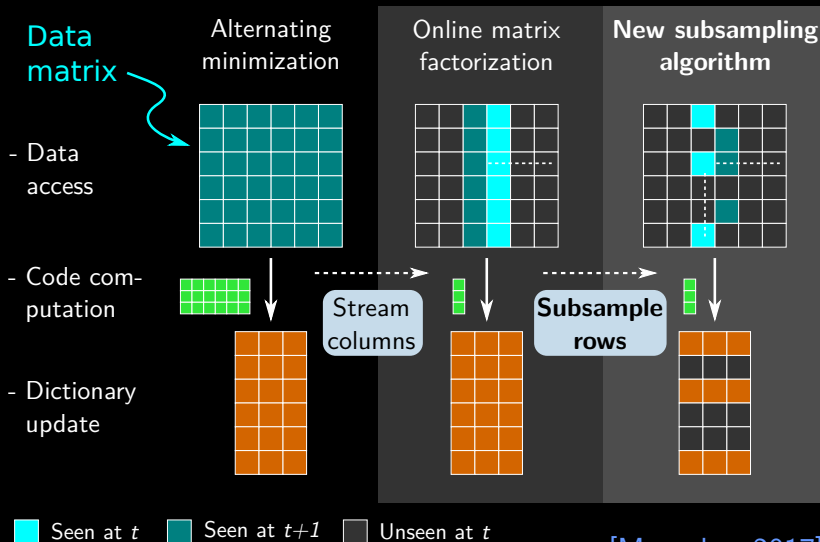

out of core, huge speed ups

[Mairal... 2010]

## 2 Stochastic factorization of huge matrices

Factorization of **dense** matrices  $\sim 200\,000 \times 2\,000\,000$

10X speed ups, or more

[Mensch... 2017]

### 3 Scaling up / scaling out?

### 3 Dataflow is key to scale

Array computing

CPU 

Data parallel

Streaming

■ Parallel computing

■ Data + code transfer

■ Out-of-memory persistence

These patterns can yield horrible code

### 3 Parallel-computing engine: joblib

```
sklearn.Estimator(n_jobs=2)
```

Under the hood: joblib

Parallel for loops

concurrency is hard

Queues are the central abstraction

### 3 Parallel-computing engine: joblib

Under  
P

Andreas Mueller @t3kcit · Feb 14

Just a quick reminder what sklearn random forests look like on EC2. want?

    # normal Joblib code
```

**Middleware to plug in distributed infrastructures**

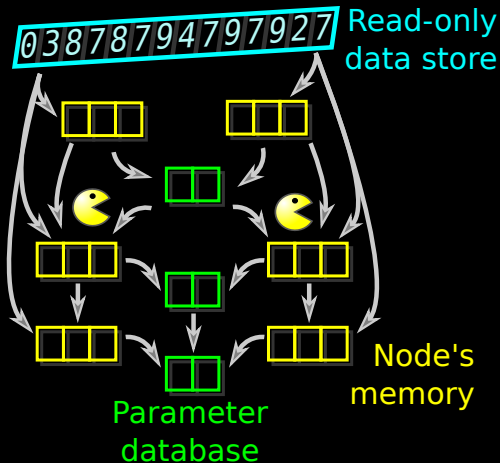

### 3 Distributed data flow and storage

Moving data around  
is costly

### 3 Distributed data flow and storage

Moving data around  
is costly

### 3 Distributed data flow and storage

03878794797927 Read-only data store

#### Why databases and not files?

- Maintain integrity themselves
- Know how to do data replication & distribution
- Fast lookup via indexes
- Not bound by POSIX FS specs

Very big data calls for coupling a database to a computing engine

### 3 joblib.Memory as a storage pool

- A caching / function memoizing system  
Stores results of function executions

### 3 joblib.Memory as a storage pool

- A caching / function memoizing system  
Stores results of function executions

- Out-of-memory computing

```
>>> result = mem.cache(g).call_and_shelve(a)
```

```
>>> result
```

```
MemorizedResult(cachedir="...", func="g", argument_hash="...")
```

```
>>> c = result.get()
```

### 3 joblib.Memory as a storage pool

```

```
MemorizedResult(cachedir="...", func="g", argument_hash="...")
```

```
>>> c = result.get()
```

- S3/HDFS/cloud backend:

```
joblib.Memory('uri', backend='s3')
```

```
https://github.com/joblib/joblib/pull/397
```

# Challenges and dreams

- High-level constructs for distributed computation & data exchange  
MPI feels too low level and without data concepts

**Goal:** reusable algorithms from laptops to datacenters  
Capturing data access patterns is the missing piece

# Challenges and dreams

- High-level constructs for distributed computation & data exchange  
MPI feels too low level and without data concepts

**Goal:** reusable algorithms from laptops to datacenters  
Capturing data access patterns is the missing piece

- Dask project:
  - Limit to purely-functional code
  - Lazy computation / compilation
  - Build a data flow + execution graph

**Also: deep-learning engines, for GPUs**

# Lessons from scikit-learn

Small-computer machine-learning trying to scale

## Python gets us very far

- Enables focusing on algorithmic optimization
- Great to grow a community
- Can easily drop to compiled code

# Lessons from scikit-learn

Small-computer machine-learning trying to scale

Python gets us very far

## Statistical algorithmics

- Algorithms operate on expectancies
  - Stochastic Gradient Descent
  - Random projections
- Can bring data locality

# Lessons from scikit-learn

Small-computer machine-learning trying to scale

Python gets us very far

Statistical algorithms

Distributed data computing

- Data access is central
- Must be optimized for algorithm
- File system and memory no longer suffice

# Lessons from scikit-learn

Small-computer machine-learning trying to scale

Python gets us very far

Statistical algorithmics

Distributed data computing

*If you know what your doing, you can scale scikit-learn  
The challenge is to make this easy and generic*
